

How to use Client Script at .cs side when update panel is present on the page

Published 11/10/2009 by [Sumit Arora](#)

Once I was trying to access client script at .cs side by using **ClientScript.RegisterStartupScript**. But somehow it didn't work. After doing some research I found the solution to it. I realised that the reason why it wasn't working was because of update panel present on the page.

```
ClientScript.RegisterStartupScript(typeof(System.String), "message",
"<script> alert('I'm unable to access it in Update Panel.');
```

It will not work if update panel is present on the page.
So in case of update panel, we will have to include the

```
<asp:ScriptManager ID="sManger" runat="server" >
</asp:ScriptManager>
```

After adding above line at .aspx side. We can access the client script at .cs side like below:

```
ScriptManager.RegisterStartupScript(this, typeof(string),
"message", "alert('It is working now.');
```

So the conclusion is if an update panel is present in the page in that case **ClientScript.RegisterStartupScript** will not work.
